Building Your First Streaming Platform

Assemble a working end-to-end streaming stack: ingest with RTMP or SRT, transcode into an ABR ladder, package for HLS/DASH, and deliver through a CDN. Covers origin servers, caching strategy, and the tradeoffs of managed versus self-hosted infrastructure.

Intermediate

🕒 15 - 20 hours

Video Streaming Fundamentals

Learn how video actually gets from a camera to a screen: containers vs. codecs, adaptive bitrate streaming, HLS and DASH basics, and the playback pipeline. By the end you will read encoding ladders and manifest files with confidence.

DRM & Content Protection

✔ **Completed**

Protect premium content end to end: how Widevine, FairPlay, and PlayReady actually work, CENC packaging, license servers, key rotation, and forensic watermarking, plus the practical tradeoffs between security and playback reach.

✧ Recommended for You

AI-powered resource suggestions based on your interests and learning journey

StreamPack - Multiprotocol live streaming broadcaster libraries for Android

StreamPack is a lightweight, high-performance toolkit for building streaming video processing pipelines on Android. It provides reusable components for frame sources, transformations, encoding, and output, making it easy to develop efficient real-time video applications with a modular and composable architecture.
